

Amira digital dissecting:

1. load data files
2. isosurface for external surface to visualize outline
3. crop region of interest
4. labeling – labelfield:
 - a. select different structures of interest and segment them into a category
 - i. external = #0
 - ii. material 1 = #1
 - iii. etc
 - b. create labeled data
5. right-click original data – compute – arithmetic

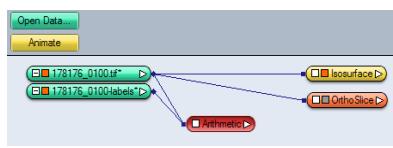

- a. Right-click left white box of arithmetic box

- b.
- c. Click "input B" to select data file where input B must be linked to ("input A" is original dataset, "input" B is based on what selection the new dataset must be created)

- d.
- e. Drag connector to the labels data box

- f.
- g. Type arithmetic expression in "Expr"-box in arithmetic dialog
 - i. E.g. when wanting to keep the structures labeled under material 1, then type: 'a*(b==1)', meaning: keep as new dataset B everything from dataset A labeled under material 1.
 - ii. E.g. when wanting to keep everything but the structures labeled under 1, then type: 'a*(b!=1)'
 - iii. E.g. when wanting to keep everything labeled under material 1 and material 2, then type: 'a*(b==1 or b==2)'
- h. Click apply-button

- i. You get a ‘result’-box, where the selected structures have been kept and the rest is deleted.
